

## Notes on the ordering process in Phase 3

In phase 3 you are only working with models for `Customer`, `Address`, and `Order` and the limitations will make the ordering process seem a little unusual at this stage. Here are some notes that hopefully add some clarity as to how it should work:

1. Since there are no items to choose from, all customers order the "standard package" which consists of 1 loaf of Honey Wheat, 1 loaf of Cinammon Swirl, 1 loaf of Sourdough Bread and 1 dozen Blueberry Muffins.
2. Since there is no login yet, a customer placing the order is on the honor system to properly select themselves as the customer and to only choose addresses that actually belong to them and not other customers.
3. Since there are no prices for items, the Baking Factory is using a "name your price" for the standard package. That is, a user can input any legitimate price they want to pay for the package.
4. The user cannot choose the date of the order; that should be automatically set by the controller when the order is created. Likewise, after a order is created successfully, the controller will invoke the 'pay' method to make sure the receipt is added to the order. (We will change this process in Phase 5 but this is how it will work here.)
